

OGW Energy Resources (OGW) analyzed solar and lighting applications for South Regency Tennis & Fitness Center (SRTFC). OGW was commissioned by SRTFC to design and install a new lighting system for their tennis court areas. We just completed this successful project and improved playability by installing fixtures higher and off court, improved the light levels by 20 foot candles (Fc), maintained the integrity of the facility's ceiling liner and improve energy efficiency.

For all our tennis center projects we provide a turnkey service that includes engineering, design, 3D rendering, photometric layout, installation with first tier state of the art product and financing as needed.

At OGW, our core competencies are in solar, lighting, wind, gas/electric procurement and working with you to provide an integrated solution that's the right fit. It's a good time to consider renewable and sustainable solutions due to subsidies and investment tax credits that are stackable with accelerated depreciation. For example, in May, 2015 we proposed a solar solution that has a kilowatt hour (kWh) rate of \$.075. The company where we proposed this is in Vandalia and their current DP&L rate is \$0.12. We have many other examples & references that we can share.

We would like to further the conversation, discuss our capabilities and listen to the overall goals and needs of your business. By doing just a little fact finding we can work towards an engineered solution that will meet your operational and energy needs while improving your cash flow. If given the opportunity, our team stands ready to work with you and exceed your expectations. Give us a call at 937-506-8133.
